

Project Initialization and Planning Phase

Team ID: SWTID-2026-4623

Team Size:5

Project Name: Import Data using Transform Maps (Spreadsheet)

Define Problem Statements

Customer Problem Statement Template

Problem Statement – PS-1

I am (Customer):

An HR administrator managing employee information in ServiceNow.

I'm trying to:

Import employee information received in spreadsheet format into the ServiceNow system.

But:

Manually entering a large number of employee records into ServiceNow is time-consuming and may result in incorrect or incomplete data.

Because:

Employee information is received as structured spreadsheet data that needs to be transferred and mapped correctly into the ServiceNow employee table.

Which makes me feel:

Concerned about data accuracy, duplicate records, and the time required to maintain employee information.

Problem Statement – PS-2

I am (Customer):

An HR administrator responsible for maintaining accurate employee records.

I'm trying to:

Update existing employee records whenever new spreadsheet data is imported.

But:

Repeated imports of the same employee information can create duplicate records if existing records are not identified correctly.

Because:

The same employee data may be received multiple times with updated information such as name or email.

Which makes me feel:

Concerned about duplicate and inconsistent employee records in the system.

Problem Statement – PS-3

I am (Customer):

An HR administrator or system administrator monitoring employee data.

I'm trying to:

Understand the imported employee data and monitor it through reports and dashboards.

But:

Reviewing large amounts of employee data manually makes it difficult to quickly understand employee distribution and import results.

Because:

Employee information contains multiple fields such as Employee ID, Name, Email, Department, and Location.

Which makes me feel:

It is difficult to monitor employee information and identify useful data trends efficiently.

Final Problem Statement

I am an HR/System Administrator managing employee information in ServiceNow.

I'm trying to efficiently import, update, validate, and monitor employee data received through spreadsheets.

But manual data entry and repeated imports can cause time consumption, duplicate records, and data management difficulties.

Because employee information is received externally in spreadsheet format and needs proper field mapping, transformation, validation, and reporting.

Which makes me feel concerned about maintaining accurate, consistent, and easily accessible employee information.
