

Data Flow Diagram

Team ID: SWTID-2026-4623

Team Size:5

Project Name: Import Data using Transform Maps (Spreadsheet)

DFD – Import Data using Transform Maps

External Entity

HR Administrator / Data Provider

Employee Spreadsheet Data

Process 1 – Prepare & Upload Data

1. Prepare and Upload Employee Data

- Employee ID
- Employee Name
- Email
- Department
- Location

Data Store 1 – Import Set Table

Employee Import

Stores the uploaded spreadsheet data temporarily for processing.

Process 2 – Transform Employee Data

2. Transform & Map Employee Data

- Source fields are mapped to target fields.
- Transform Map processes the imported data.
- Coalesce checks existing Employee ID records.

Data Store 2 – Employee Test Table

Employee Test

Stores the final employee records.

- New records → Inserted
- Existing records → Updated
- Duplicate unchanged records → Ignored

↓

Process 3 – Validate & Generate Reports

3. Validate Employee Data & Generate Reports

- Check imported records.
- Check Transform History.
- Generate department-wise report.
- Generate location-wise report.
- Generate employee list report.

↓

Data Store / Output – Dashboard

Employee Analytics Dashboard

Displays:

- Employee information
- Department-wise employee distribution
- Location-wise employee distribution
- Employee list
- Import and update results

Data Flow

Spreadsheet → Import Set → Transform Map → Employee Table → Reports → Dashboard

The project documentation confirms that spreadsheet data is loaded into an Import Set table, mapped through a Transform Map, and transformed into the Employee Test table.
